Pharmaceutical Department

2016

Annual Report
2016 Annual Report
Pharmaceutical Department

Faculty • Full Members: William E. Evans, PharmD; William Greene, PharmD; Mary V. Relling, PharmD (chair); Erin G. Schuetz, PhD; John D. Schuetz, PhD, Clinton F. Stewart, PharmD; Associate Members: James M. Hoffman, PharmD; Jun J. Yang, PhD; Assistant Member: Daniel Savic, PhD; Research Associate: Liqin Zhu, PhD

Staff Scientists • Barthelemy Diouf, PhD; Amarjit Chaudhry, PhD; John Lynch, PhD; Yu Fukuda, PhD
Laboratory Directors • Alejandro Molinelli, PhD; Kristine R. Crews, PharmD
Fellows • Ju Bao, PhD; Jordan Beard, PhD; Emily Finch, PhD; Yoshihiro Gocho, MD, PhD; Charnise Goodings, PhD; Zachary Jones, PhD; Seth Karol, MD; Chengcheng Liu, PhD; Yiwei Liu, PhD; Elixabet Lopez Lopez, PhD; Robert McCorkle, PhD; Takaya Moriyama, MD, PhD; Yogesh Patel, PhD; Aaron Pitre, PhD; Maoxiang Qian, PhD; Aksana Vasilyeva, PhD; Juwina Wijaya, PhD; Hui Zhang, MD, PhD
Residents • Jennifer Hockings, PharmD, PhD; Nick Lockhart, PharmD; Deni Trone, PharmD, PhD; Dagny Ulrich, PharmD, PhD
Graduate Students • R.J. Autry, Ashley Crumby, Samit Ganguly, Nick Keeling, Xuje Zhao

Overview:

The primary goal of the Pharmaceutical Sciences Department is to improve therapy for children with catastrophic diseases by elucidating the basis for interpatient variability in response to medications. Survival rates for children with cancer, hematologic disorders, HIV infection, or other serious diseases continue to increase, largely through the improved use of medications. Failure of current therapies and unacceptable adverse effects are partly due to less-than optimal prescribing. Our goal is to elucidate the biological basis of interindividual differences in pharmacologic response, and to translate our findings into improving patient care.

Heterogeneity in the metabolism, transport, elimination, targets, and receptors of many drugs and consequent variability in therapeutic or adverse effects may result from germline genetic differences or genetic alterations in malignant cells. Drug response is also influenced by nongenetic factors (e.g., drug interactions, host organ function and maturity, disease severity, adherence to therapy).
We develop preclinical models to systematically characterize the determinants of human variation in drug response, and we integrate our work into translational clinical studies (Figure 1). Laboratory work informs clinical studies, and clinical problems drive much of the laboratory work. Faculty members lead and participate in interdisciplinary St. Jude programs and national cooperative research collaborations. Our pharmacogenetic research integrates genome-wide analyses, molecular analyses, functional genomics, pharmacokinetics, and pharmacodynamics to identify genetic determinants of drug effects, with the long-term goal of optimizing therapy for individual patients. The Department comprises both Pharmaceutical Sciences and Pharmaceutical Services, and includes ten faculty members, 15-25 post-doctoral fellows (Figure 2) and residents (Figure 9), 10-20 undergraduate and graduate students, over 45 pharmacists, and over 110 full time staff members working as computing experts, research nurses, technical, laboratory, administrative, and clinical staff. The department is supported by multiple NIH grants. The research in the department includes clinical pharmacology, pharmacokinetics, pharmacodynamics, and pharmacogenomics. Pharmaceutical Sciences occupies over 15,000 sq. ft. of contiguous state-of-the-art equipped laboratory and office space, and Pharmaceutical Services occupies over 18,000 square feet of space in the clinical areas of St. Jude. The department hosts weekly research workshops and journal clubs that are open to the entire institution and are widely attended by colleagues outside the department, in addition to multiple laboratory or Services specific meetings, webinars with national and international colleagues, and regular pharmacogenomics meetings.

*Figure 1. With responsibility for medications, the use of clinical data, and the development of clinical and research laboratory tests, knowledge is used to provide the best possible care for St. Jude patients while making discoveries with implication outside of St. Jude.*
Pharmaceutical Department faculty, staff, and trainees work closely with each other; with our collaborators in other departments at St. Jude; and with colleagues around the world on basic translational, and clinical research projects and to provide outstanding pharmaceutical care to St. Jude patients.

Faculty:

**William E. Evans, PharmD**

Research in the Evans lab is focused on the pharmacogenomics of anticancer agents, with an emphasis on childhood acute lymphoblastic leukemia (ALL) (reviewed in Evans and Relling, *Nature* 2004; Pui and Evans, *NEJM* 2006; Paugh et al, *Clin Pharmacol Ther* 2011; Relling and Evans, *Nature* 2015). Several approaches are currently being used to identify genes and genome variations that are important determinants of the disposition and effects of antileukemic agents, including the use of genome wide approaches such as gene expression profiling (mRNA, microRNA) of leukemia cells, genome-wide SNP analyses (germline and somatic) and whole exome/genome sequencing of patient cohorts that have been uniformly treated and evaluated on prospective clinical trials at St. Jude Children’s Research Hospital (reviewed in Evans and Relling, *Nature* 2004).

---

**Figure 3.** CASP1 causes glucocorticoid resistance via glucocorticoid receptor cleavage. Increased expression of inflammasome components CASP1 and NLRP3 via somatic hypo-methylated promoter regions leads to glucocorticoid receptor cleavage by CASP1. Decreased levels of functional glucocorticoid receptor leads to blunted transcriptional response to glucocorticoids, glucocorticoid resistance in ALL cells and is associated with inferior treatment outcome (see Paugh et al, *Nature Genet* 2015).
and Relling, *Nature* 2004), or by our collaborators in the COG and in Europe (eg, Princess Maxima Center, Utrecht). Ongoing studies are investigating genes that the lab has linked with resistance to antileukemic agents (Figure 3) (Holleman et al, *NEJM* 2004; Lugthart et al, *Cancer Cell* 2005), and genes linked to the disposition (Kager et al, *JCI* 2005; Zaza, *Blood* 2005) or pharmacologic targets (Diouf et al, *JAMA* 2015; Paugh et al, *Nat Genet* 2015) of antileukemic agents as well as the influence of somatic and karyotypic abnormalities on genotype-phenotype concordance (Cheng, *Nature Genetics* 2005; Diouf et al, *Nature Med* 2011). Work in the lab is funded by a long-standing R01 from NCI (CA36401, W. Evans, PI), a project in the Center for Precision Medicine P50 Grant from NIGMS as part of the NIH-funded Pharmacogenetics Research Network (GM115279, M. Relling PI), by a Cancer Center Support grant from NCI (CA21765 C. Roberts,PI), and by ALSAC, the fundraising organization for St. Jude Children’s Research Hospital. The lab comprises a number of post-doctoral fellows, staff scientists, research technologists, bioinformaticists, computational scientists and students, working with collaborators at St. Jude (including Mary Relling, Ching-Hon Pui, Charles Mullighan, K. Roberts, Hiroto Inaba, Kirsten Ness and Jun Yang as major collaborators, plus additional physicians, clinical pharmacists, research nurses and other staff at St. Jude), and with collaborators at other institutions in the US (HudsonAlpha, University of Chicago) and Europe (Erasmus University, Princess Maxima Center). The lab’s overall goals are to elucidate genomic determinants of toxicity and efficacy of anticancer agents and translate this knowledge into new diagnostics and treatment strategies to optimize the therapy of ALL (Relling and Evans, *Nature* 2015; Dunnenberger et al, *Ann Rev Pharmacol Tox* 2015).

**William Greene, PharmD**

I joined Pharmaceutical Services as Chief Pharmaceutical Officer in August 2007. I have had a long career as a clinical pharmacy practitioner and leader in development of drug policy in hospital-based practice. My interests have been diverse and are summed up in the goal of developing structures, personnel, policy and practice to accomplish the best possible system to assure optimal outcomes of pharmacotherapy. My interests in Infectious Diseases, Pharmacokinetics, Performance Improvement and Medication Safety continue.

As the senior leader of Pharmaceutical Services, it is my goal to assure the best possible design and function of pharmacy services to assure that we achieve the desired outcomes of drug therapy for St. Jude patients. To this end, Pharmaceutical Services collaborates closely with other disciplines in providing patient care, and with clinicians and scientists in translational and clinical research, and employs the principles of continuous process improvement in ongoing refinement/improvement of patient-related services. Clinical research in Pharmaceutical Services has focuses on collaboration in applying pharmacokinetic, pharmacogenetic, and therapeutic drug monitoring principles to patient care, and in improving the safety of medication use. I currently retain a faculty appointment with the University of Tennessee College of Pharmacy (Professor, Affiliated), and am active in national and state professional organizations (immediate past member of the Board of Directors of Tennessee Pharmacists Association).

**James M. Hoffman, Pharm**

I joined the Pharmaceutical Department in 2004, and the St. Jude Faculty in 2011. My career has focused on evaluating and improving complex medication use systems, and I currently provide leadership to evaluate and improve a range of patient care processes through my role as the hospital’s Chief Patient Safety Officer. I am also dedicated to postgraduate training by directing specialized residency program in Medication-Use Safety. My research is focused on patient safety
event detection, patient safety culture, and clinical decision support. Our work on patient safety event
detection and reporting systems is built on our department’s leadership to develop and implement St.
Jude’s novel electronic event reporting system software (EERS).

EERS is used to report all patient safety events at St. Jude, and this system has resulted in a 20% increase in event
reporting. Because a healthy patient safety culture is essential to safe care, we have focused on assessing patient safety
culture at St. Jude and devised new tools to measure specific aspects of safety culture in the hospital setting
I also lead a variety of efforts to expand and improve the use of clinical decision support (CDS) in the electronic health
record (EHR) Through the PG4KDS protocol, St. Jude is a leader in
incorporating pharmacogenetic data and associated CDS into the EHR (Bell et al, JAMIA, 2013) (Figure 4), and I have
contributed to this protocol as an investigator since its inception. I have
also been actively engaged in the Clinical Pharmacogenetic Implementation
Consortium (CPIC) since its inception, and I co-lead the CPIC Informatics
Working Group. CPIC has devised vendor
agnostic implementation resources which are available for each guideline
(Hoffman et al. JAMIA, 2016). CPIC also
recently lead a consensus process to
standardize pharmacogenetic terms, which is being widely adopted and will help facilitate sharing pharmacogenetic
results across disparate clinical
information systems. (Caudle et al. Genet
Med. 2016)

**Figure 4.** Post-test alerts interrupt clinicians to change prescribing
only when a high-risk drug is ordered for a patient with a high-risk
pharmacogenetic phenotype. Clinical implementation of
pharmacogenetic tests is part of the medication safety program
for St. Jude (J. Hoffman).

**Mary V. Relling, PharmD**
I have been a faculty member in the Pharmaceutical Department at St. Jude since 1988. Since then, the
majority of my efforts have been directed to translational research in childhood acute lymphoblastic
leukemia (ALL), although I have also maintained clinical involvement at St. Jude and in the Children’s
Oncology Group (COG). The clinical problems faced by children with ALL drive my research. Much of
the work of my laboratory focuses on finding the genetic basis of why patients and their tumor cells
differ from one another. I co-lead the Center for Precision Medicine in Leukemia (CPML), a
multidisciplinary research group [http://www.pgrn.org/precision-medicine-in-leukemia.html]. We also study how nongenetic factors (e.g., diet and drug interactions, kidney and liver function, and age) affect how patients differ from each other in response to medications.

The ALL phenotypes we focus on most include relapse, glucocorticoid induced osteonecrosis (Figure 5) and asparaginase immunogenicity and pharmacodynamics. Our laboratory has a heavy reliance on computational approaches, as we use genome-wide tools to interrogate genetic variability. We also use chemical analyses (e.g. HPLC, LC/MS) to study medication pharmacokinetics, cell culture models, molecular biologic techniques, murine models, and analysis of clinical outcomes and phenotypes. In 2011, we opened a clinical protocol, PG4KDS, with the goal of using array-based clinical genotyping to implement preemptive pharmacogenetic tests into clinical care for St. Jude patients (Dunnenberger et al. 2014, Hoffman et al. 2014). We collaborate with many investigators within the department, throughout St. Jude, within the COG, and within the Pharmacogenomics Research Network (PGRN).

![Manhattan plots of inverse log p values for associations of germline SNP variants with risk of osteonecrosis in patients with ALL and in adults without ALL (top panel, Karol et al 2015) and in patients younger than 10 years of age (bottom panel, Karol et al, 2016). Variants in glutamate receptor genes were associated with osteonecrosis in all cohorts.](image)

**Erin G. Schuetz, PhD**

I joined the St. Jude Pharmaceutical Sciences Department in 1993. My lab studies cytochromes P450 (CYP) and other enzymes that metabolize many of the drugs administered to St. Jude patients. The lab identifies genetic determinants explaining variation in hepatic and intestinal CYP and AOX activities and, hence, variation in drug efficacy, toxicity and, ultimately, therapeutic outcome. The lab strategically uses both the candidate gene approach and exploits network and pathway analysis tools to illuminate the genetic variation in novel candidate genes affecting the CYP genetic network. The liver system biology/network approach has identified the node genes that, when individually perturbed, co-regulate many genes in the CYP network. My lab then uses deep resequencing of these novel candidate genes, and allelic expression imbalance analysis, to identify the functional and regulatory variants responsible for altering CYP activity and driving changes in the CYP expression network. Standard molecular, cellular and biochemical studies are then used to determine the functional consequence of these variants. Retrospective association studies are performed to determine
if functional variants in candidate genes translate to clinical differences in CYP mediated drug clearance.

Most recently our studies have focused on studying the impact of Vitamin D3 (VD3) sufficiency versus insufficiency on survival and chemotherapeutic efficacy and toxicity in a mouse model of acute lymphoblastic leukemia with the BCR-ABL fusion gene. These studies were prompted by the fact that a significant percentage of the pediatric population is VD3 deficient or insufficient, and that VD3 levels are further eroded during therapy because anti-chemotherapeutic regimens decrease the levels of the biologically active form of vitamin D3. Hence a major long-term consequence is a loss of bone mineral density in these pediatric patients during their peak bone building years. As a result, clinical trials have been initiated to determine whether vitamin D supplementation can correct VD3 insufficiency and improve bone density in children treated for leukemia. However, there was also a concern that vitamin D supplementation might cause drug interactions with medications metabolized by some drug metabolizing enzymes and drug transporters because the expression of some of them is regulated by VD3. Our results found that VD3 supplementation had no effect on the pharmacokinetics of glucocorticoids. However, because our results demonstrated a significant effect of VD3 on survival of mice from the BCR-ABL+ leukemia, and that the combination of VD3 and glucocorticoid therapy may prove beneficial in treating BCR-ABL+ leukemia, efforts are underway to determine the mechanisms by which VD3 mediates these effects.

**John D. Schuetz, PhD**
A member of the Pharmaceutical Sciences Department since December 1992, my laboratory focuses on understanding the contribution of ABC transporters to pathological processes and pharmacological response using cell culture model systems as well as gene knockout models (e.g., reviewed *Ann Rev Pharm Tox*, 2006 and 2013). Using these model systems, we have, through collaborative effort with other SJCRH investigators identified one ABC transporter as an important stem cell marker (Zhou et al, *Nat Med*, 2001, Zhou et al, *PNAS*, 2002) that has a prominent role in hematopoietic cell Survival under hypoxia (Krishnamurthy et al, *J Biol Chem*, 2004). We extended these studies to establish a knockout mouse which revealed for the first time that the ABC transporter (ABCC4/Mrp4) was important in protecting the brain from penetration of chemotherapeutic agents (Leggas et al, *Mol Cell Biol*, 2004). One could infer from these findings that the therapeutic efficacy of CNS-directed drugs that are Mrp4 substrates may be improved by developing Mrp4 inhibitors. The ABCC4/Mrp4 transporter was first functionally defined by my laboratory (Schuetz et al, *Nat Med*, 1999) and more recently was demonstrated to protect hematopoietic cells from injury due to the widely used immunosuppressive and cancer chemotherapeutic agent 6-mercaptopurine. This finding allowed us through collaborative efforts within the department (Evans, Relling, E. Schuetz) to identify a defective ABCC4 allele that was prevalent in the Asian population, thus providing an explanation for the anecdotal reports of enhanced sensitivity to the toxic hematopoietic side-effects of 6 mercaptopurine in this population (Krishnamurthy et al, *Cancer Res*, 2008). Further studies suggest ABCC4 has a strong role CFTR (L et al, *Cell*, 2007) and also in modulating platelet aggregation as well as response to anti-platelet drugs (Cheepala, Pitre, et al, *Blood* 2015). Other studies have focused on a mitochondrial and plasma membrane ABC transporter we first characterized (Krishnamurthy et al, *Nature*, 2006; Fukuda et al, *J Biol Chem*, 2011) that protects cells from oxidative stress (Lynch et al, *Cancer Res*, 2009) and appears to have a unique role in regulating other survival responses. Because over a third of ABC transporters contribute to disease processes, our goal has been to understand the role of these genes in pathological conditions, such as our recently described roles for the bile acid transporter, *Abcb11*, in protecting against neonatal respiratory distress (Zhang et al, *Nat Commun*, 2015) and the ABCB6 transporter in modifying the severity of porphyria caused by defects in heme biosynthesis (Fukuda et al, *Nat Comm*, 2016). From this perspective, we have also been elucidating
how select ABC transporters contribute to cancer (medulloblastoma) (Morfouace et al, *Cancer Res.* 2105) and therapeutic response.

**Clinton F. Stewart, PharmD**

I joined the Pharmaceutical Department at St. Jude in 1991, and since then have focused my research efforts in developmental therapeutics for children with solid malignancies and central nervous system tumors. In the clinic, my research involves the application of state of the art pharmacokinetic (individual and population), pharmacogenetic, and pharmacodynamic approaches to understanding the variability in drug disposition in children with cancer. Little is known about the disposition of anti-cancer agents in infants and young children less than 3 years of age, which often leads to increased risk of morbidity, poor tumor control, and increased incidence of late effects. Thus, we have embarked on a comprehensive series of pharmacokinetic, pharmacogenetic, and pharmacodynamic studies to understand how developmental changes in infants and young children affect the disposition and toxicities of anticancer drugs used in the treatment of infants with malignant brain tumors. Our long-term goal is to determine rational dosing regimens for infants and young children by better understanding the developmental pharmacology of anti-cancer drugs and to apply these regimens to therapy for other childhood malignancies and chronic medical conditions. In addition to the studies we perform at St. Jude, my lab collaborates with investigators within the Pediatric Brain Tumor Consortium and the Children’s Oncology Group. Our work in the laboratory is guided by addressing clinically relevant problems encountered in the therapy of children with solid malignancies (e.g., effect of antiangiogenic drugs on cytotoxic drug penetration) or brain tumors (e.g., CNS drug penetration in brain tumors). The studies in the lab are designed to either yield data that can be translated into the design of improved clinical trials or to answer questions generated in the clinic. For example, the treatment of children with primary central nervous system (CNS) tumors continues to be a challenge despite recent advances in technology and diagnostics. A variety of issues unique to
pediatric CNS tumors impede development and clinical success of novel therapies and for this reason safe and effective treatments remain elusive. The preclinical approach we use (Figure 6) employs tumor subgroup-specific models of pediatric CNS tumors, cerebral microdialysis sampling of tumor extracellular fluid (tECF), and pharmacokinetic modeling and simulation to overcome challenges that currently hinder researchers in this field.

**Jun I. Yang, PhD**
I joined the St. Jude faculty in 2010 and I am currently an Associate Member in Pharmaceutical Sciences Department. The research focus of my group is pharmacogenomics of treatment outcomes (e.g. relapse) and toxicity in children with childhood acute lymphoblastic leukemia (ALL). Primarily taking a genome-wide approach, we identify genetic variations that contribute to interpatient variability in response to ALL therapy. By doing so, the goals of our research are to elucidate biological pathways dictating response to antileukemic drugs, to identify genetic predictors for drug resistance which can be utilized for treatment individualization, and to develop novel therapeutic agents to overcome drug resistance. Because genetic factors in both host and tumor genome can affect drug response, my lab has focused on characterization of inherited (germline) and acquired (somatic) genetic factors that are associated with treatment response in childhood ALL. We have led the first genome-wide association study to identify germline genetic variations associated with minimal residual disease in response to remission induction therapy in children with ALL (Yang et al, *JAMA, 2009*) and the first genome-wide interrogation of copy number alterations related to ALL relapse (Yang et al, *Blood, 2008*). We are particularly interested in the genetic basis for racial/ethnic differences in ALL treatment outcomes and disease susceptibility, e.g. we recently performed genome-wide studies to characterize ancestry-related genetic variants that (Perez-Andreu et al, *Nat Genet 2013, J Clin Oncol 2012, J Natl Cancer Inst 2013*) contribute to higher risk of relapse in Hispanic children with ALL (Yang et al, *Nat Genet, 2011*). We are also interested in pharmacogenetics of treatment toxicity, especially thiopurine-related myelosuppression (*J Clin Oncol 2015, Nat Genet 2016*). Our group is part of the NIH Pharmacogenomics Research Network (PGRN) and the Center for Precision Medicine for Leukemia (CPML).

**Daniel Savic, PhD**
I joined the Pharmaceutical Sciences Department at St. Jude Children’s Research Hospital in August of 2016. My broad research interest involves deciphering the intricate, molecular processes that orchestrate the spatial and temporal regulation of genes, and how alterations to this regulatory logic contribute to disease. Prior to my faculty appointment at St. Jude, I was a member of the Encyclopedia of DNA Elements (ENCODE) consortium, a large, multi-center, collaborative effort that aims to functionally annotate the human genome. To better understand genome structure and function, I applied a variety of functional genomic techniques and next-generation reporter assays (Savic et al. * Genome Research 2015*, Savic et al. * Genome Medicine 2016*, review in Engel et al. *Semin Cell Dev Biol* 2016), and further engineered novel ChIP-seq based technologies that expand the utility (Savic et al. * Epigenetics and Chromatin* 2013) and enhance the capacity (Savic et al. * Genome Research 2015*) of the ChIP-seq functional genomic assay.

My laboratory at St. Jude focuses on the pharmacogenomics of treatment in pediatric acute lymphoblastic leukemia (ALL) in order to better understand the molecular underpinnings of anticancer drug resistance and disease relapse. Our group aims to address a critical question in ALL pharmacogenomics: how does the non-coding, regulatory genome impact drug response and disease
relapse? To address this question, the main goals of our concerted research effort are: (1) to systematically identify “drug-response CREs” (drCREs), (2) to define the molecular mechanisms linking drCREs to drug resistance, (3) to connect non-coding, DNA sequence variation with differences in interpatient drug sensitivity, and (4) to assess epigenomic heterogeneity and clonal evolution in leukemic blasts.

Liqin Zhu, PhD
I joined Pharmaceutical Sciences Department as a Research Associate in 2016. My research program focuses on understanding the metastasis mechanisms of pediatric hepatoblastoma (HB) and hepatocellular carcinoma (HCC) to facilitate the development of effective and personalized therapy for the aggressive forms of liver cancer. We use three main approaches to study HB and HCC metastasis, including: (1) using in vitro 3D liver stem cell culture to grow liver cancer spheroids from mouse and human tumors and characterize the mechanisms contributing to their tumorigenicity; (2) generating cancer spheroid-driven orthotopic transplantation mouse models for liver cancer and characterize the in vivo mechanisms driving liver cancer metastasis; (3) conducting liver cancer spheroid-based drug screen to identify new treatment for metastatic HB and HCC. Our preliminary study has demonstrated the ability of liver cancer spheroids to drive highly invasive and metastatic tumors in vivo. The liver cancer spheroid-driven secondary tumors faithfully recapitulate human recurrent and metastatic liver cancers at both histologic and molecular levels, which has provided us a novel preclinical model to identify potential new therapies for high risk liver cancers that are otherwise refractory to standard-of-care treatments.

Pharmaceutical Services
Pharmaceutical Services is led by Dr. William Greene and is staffed by pharmacists, pharmacy technicians, research and administrative staff, and faculty, (see Organization Chart at end) all dedicated to helping patients. St. Jude Pharmaceutical Services focuses on providing the best pharmaceutical care required for each child at SJCRH while supporting a collective research endeavor. Our personnel, working with other caregivers in a cutting edge collaborative environment assure the best possible outcomes of drug therapy. Nearly 120 pharmacists, technicians, and other support personnel are involved in the care of patients and support of clinical research at St. Jude, helping to fulfill our organizational mission to “advance cures, and means of prevention, for pediatric catastrophic diseases through research and treatment.”

Figure 7. Just for the CYP2D6 gene, 56 different diplotypes have been observed in the first 499 patients enrolled on the St. Jude clinical protocol, PG4KDS. Each diplotype is translated into a phenotype; high-risk phenotypes drive drug prescribing (Hicks et al 2012).
Pharmaceutical Services addresses St. Jude patients across the continuum of care – providing services while they are inpatients, in the outpatient clinic, and while in domiciliary facilities or at home. Inpatient services include Clinical Pharmacist collaboration in management of patients of all major clinical patient care groups, including Leukemia/Lymphoma, Solid Tumor, Neuro-Oncology, Bone Marrow Transplant, Hematology, and HIV services. After discharge from the hospital, these patients are seen in outpatient clinics located on campus where pharmacists are directly involved with provider teams. In these settings, pharmacists collaborate in the care of these patients, including the ordering of medications and laboratory tests, the development of clinical treatment protocols, provision of drug therapy and nutritional support consults, and assessment and management of the long-term effects of medication therapy. An on-site infusion center pharmacy provides medications for outpatients, and is fully staffed by pharmacists. On average, there are approximately 400 patient clinic visits per day, with 103 infusion center encounters, leading to the dispensing of 802 prescriptions or doses per day. An inpatient census of approximately 58 patients per day requires more than 2,150 dispensed doses per day. Nutrition support, pharmacokinetic, and pharmacogenetic consults, (Figure 7) and routine medication reconciliation at discharge require direct pharmacist involvement in patient care. Patients requiring intravenous therapy while outside the hospital are managed through provision of therapy by the St. Jude Specialty/Home Infusion Pharmacy. This service, initiated in early spring of 2011, was recognized by a Joint Commission surveyor as exhibiting several “best practices” and having no recommendations for improvement during surveys in August of 2011 and November 2012. This service is now providing more than 340 doses per day, and is caring for all St. Jude patients in the immediate service region.

At St. Jude, we provide the very best professional environment for pharmacists (Figure 8) – one that supports growth and achievement of professional goals. Clinical Staff Pharmacists work from both centralized and decentralized settings to collaborate with clinical providers in patient care. Clinical Research Pharmacists, Informatics Pharmacists, and pharmacist leaders in medication outcomes and medication safety work to assure optimal system support and design to facilitate the best outcomes of patient care and clinical research. Certified Pharmacy Technicians collaborate with pharmacists to assure excellence in operational functions. A technician career ladder has been developed, and pharmacist developmental pathways provide internal opportunities for professional growth.

Professional society involvement is encouraged, and resources are dedicated to enhance professional growth. St. Jude pharmacists play an active role in the Children’s Oncology Group, American College of Clinical Pharmacy, American Society of Health-System Pharmacy, and many other professional organizations.

St. Jude Pharmaceutical Services also collaborates closely with various colleges of pharmacy in providing experiential education to pharmacy students. The department is formally affiliated with
the University of Tennessee (UT) College of Pharmacy, but also works with students from other colleges as they request the opportunity. Members of the department hold affiliated faculty appointments with the UT College of Pharmacy. St. Jude pharmacy personnel provide approximately 60 student-months of experience during an academic year and 40 contact hours of classroom training for UT pharmacy students.

Pharmacists are integrated into each of the major clinical services at St. Jude and state-of-the-art distribution and computer support systems assure efficient, effective delivery and use of medications. Pharmacy Information Systems is intimately involved in the maintenance and refinement of a complete electronic medical record with computerized prescriber order entry and clinical decision support. These same personnel lead efforts to identify and implement the best technology to ensure optimal and safe patient outcomes.

**Pharmacy Specialty Residencies**

Trainees at St. Jude are supported by an institutional Office of Academic Programs, whose goal is to assist our investigators and professional staff to improve the quality of experiences, training, benefits, and support for our undergraduate, graduate, professional and postdoctoral trainees.

Over 300 post-doctoral trainees (post-Ph.D, M.D, and Pharm.D.) are at St. Jude, among whom are our PGY2 pharmacy specialty residents. Our PGY2 residencies in Pediatric Oncology, Medication Use Safety, and in Pharmacogenomics are accredited by the American Society of Health System Pharmacists (ASHP). Further details are available on St. Jude’s website (www.stjude.org/pharmacyresidency).

**Pharmacokinetics Shared Resource**

The Pharmacokinetics Shared Resource is part of the NCI-designated Cancer Center, is housed within Pharmaceutical Sciences laboratory space, is directed by Dr. Mary Relling, and provides centralized high-quality, competitively funded, peer-reviewed pharmacokinetic/pharmacodynamics research in both clinical and pre-clinical models at the St. Jude Cancer Center.

Our objectives are to facilitate:

- Proper pharmacokinetic study design and implementation
- Efficient and proper collection of biological samples for clinical pharmacokinetic and pharmacodynamic studies

Implementation and quality control of sensitive and specific analyses of those samples for anticancer drugs, their metabolites, or other relevant pharmacologic indices
The biomedical modeling of pharmacokinetic and pharmacodynamic data

Services include:
Protocol implementation (development of standard physician orders; building computerized laboratory tests; refining sampling and processing procedures)
Research sample acquisition (centralized receiving, initial processing, storage, and distribution)
Analytical assay implementation and ongoing quality control, biomedical modeling, study design and optimal sampling

Clinical Pharmacokinetics Laboratory

The Clinical Pharmacokinetics Laboratory (CPKlab), located in the Pharmaceutical Department supports St. Jude’s mission by providing state of the art therapeutic drug monitoring and pharmacogenetic testing that is interpreted by clinical pharmacists to assure optimal drug dosing. It is directed by Dr. Alejandro Molinelli with translational support from Dr. Kristine Crews.

The Clinical Pharmacokinetics Laboratory is certified as a high complexity laboratory by CLIA and is accredited by the College of American Pathologists. Our staff consists of licensed medical laboratory scientists. Every year the laboratory will process and analyze approximately 8000 clinical specimens and send-out another 300 to reference laboratories. The laboratory's in-house test menu includes multiple high-complexity assays ranging from therapeutic drug determinations (e.g. immunosuppressant, antifungal drugs) to glomerular filtration rate estimation using 99mTc- DTPA. Some of our resources include random access immunochemistry analyzers (e.g. Abbott Architect) and analytical instrumentation (e.g. LC-MS/MS, GC/MS, HPLC). Most of our instruments have bidirectional interfaces with the Cerner Millennium clinical informatics system. The laboratory also handles pharmacogenetic testing for the hospital offering genotyping results that are always accompanied by consults prepared by the clinical pharmacists or residents.

The laboratory staff and pharmacists at St. Jude work closely to provide results in a timely manner. Once a test result is obtained the laboratory scientists alert the pharmacist, who in turn prepares a clinical consult. This close integration of care assures that our patients receive the best treatment while minimizing adverse effects from the drugs. The laboratory staff is also involved in clinical translational science projects, for which tests developed in the research laboratories are validated and incorporated into the CPK lab test menu as needed.

In addition to the samples for clinical testing, the CPK laboratory staff members also process thousands of patient research specimens a year, in support of various St. Jude research protocols, for the Pharmacokinetics Shared Resource.
